EXAMINER'S AMENDMENT

Election/Restrictions

The restriction requirement is withdrawn due to applicant's amendment, wherein claim 28 now depends from claim 1. All claims (1-28) were examined.

Examiner's Amendment

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Derek Richmond (Reg. No. 45,771) on April 11, 2006.

The application has been amended as follows:

The title is changed to "Auto-focusing method and device for use with optical microscopy".

In claim 8, line 4, replace "out of focus" with --out-of-focus--.

In claim 15, line 2, replace "the surface" with --a surface--.

In claim 15, line 10, replace "the focal plane" with --a focal plane--.

In claim 15, line 23, replace "the surface" with --a surface--.

In claim 19, line 3, remove the word "the" before "collected reflected radiation".

In claim 20, line 2, replace "to slower" with --to slow--.

Reasons for Allowance

Claims 1-28 are allowed.

The following is an examiner's statement of reasons for allowance:

With respect to claims 1 and 15, prior art fails to teach or reasonably suggest the detected reflected components characterized by a first intensity peak corresponding to an in-focus position of the opposite surface of the substrate and a second intensity peak corresponding to an in-focus position of the sample-supporting surface of the substrate, in addition to the other limitations of the claim.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Manian et al. (US 6,441,894) discloses an apparatus for autofocusing that continuously detects reflected radiation which is characterized by one intensity peak that corresponds to an in-focus position of the opposite surface of the substrate. Manian et al. discloses in another embodiment, the intensity peak corresponds to an in-focus position of the sample-supporting surface of the substrate.
